Clinical Neurophysiology National Audit Conference

The programme included an introduction giving the rationale behind the National Audit projects followed by an overview of the departmental accreditation process (IQIPS). Each of the 3 audit projects was presented and included a literature review of the topic. All presentations can be viewed on the accompanying PowerPoint slides (see links below).

The results of the hyperventilation and video telemetry projects were used to draw up provisional National Standards and Guidelines. On the basis of the ensuing group discussion these Standards and Guidelines will be subject to revision and then circulated to professional body members before publication on the BSCN and ANS websites.

The audit of the BSCN/ANS Standards for nerve conduction studies in CTS resulted in the recommendation to return to the original version of the standards ie changing Standard 5 to a Guideline. Feedback on adherence to the CTS standards for individual centres can be given confidentially on request from Jeff Holman (Jeffery.holman@porthosp.nhs.uk).

The day concluded with a discussion session to obtain ideas for further projects. Suggestions for further work included:

- Photic stimulation: review of protocols, safety and efficacy (Aghi Ponnusamy)
- The use of melatonin for sleep induction (Caroline Ross)
- Infection Control standards (Richard van der Star)
- Information Governance (Adrian Fowle)
- Archiving EEGs (Benny Thomas)
- BSCN/ANS Ulnar nerve standards (Ros Kandler)
- Standards for diagnosing AIDP (PP Chaudhary)
- Glut 1 deficiency and epilepsy (Ming Lai)
- Measurements in CTS NCS protocols (Martin Koltzenburg)
- Grey cases with interactive participation (Ros Kandler)
- NCS/EMG protocol in patients with ICDs (Nicola Broomfield – received by email)
- Minimum length of EEG recording (Chris Fisher – received by email)

The view of the participants was that a similar conference should be run every 2 years separate to the regular BSCN and ANS scientific meetings.
